

Edit (command)

Dmitriy Eshenko - 2019-10-01 - 0 Comments - in CLI Reference

The **edit** command allows you to navigate down into the configuration tree. To get back to an upper level, use the **up** command or use the **top** command to get back to the upper most level. The [edit] text displays where the user is located in the configuration tree.

Syntax

```
[edit]
vyos@vyos-rtr# edit <section>
```

Examples:

To navigate from the top level down to the interfaces section:

```
[edit]
vyos@vyos-rtr# edit interfaces
[edit interfaces]
vyos@vyos-rtr#
```

As expected, the [edit] changed to [edit interfaces]. It's possible to navigate down multiple levels at once:

```
[edit]
vyos@vyos-rtr# edit interfaces ethernet eth0 vif 222
[edit interfaces ethernet eth0 vif 222]
```

It's possible to navigate to any node further down, it's not necessary to start from the top:

```
[edit]
vyos@vyos-rtr# edit interfaces
[edit interfaces]
vyos@vyos-rtr# edit ethernet eth0
[edit interfaces ethernet eth0]
```
